

GrowthBridge Ventures

Digital Marketing Agency Market Analysis — Lucknow, Rae Bareli & Gomti Nagar Region

Prepared by	Tabish Afzal
Role	Data Analyst (Portfolio Project)
Tools used	Python , MySQL, Power BI
Date	September 2026

1. Business Problem

You've just been hired as a **Data Analyst** by **GrowthBridge Ventures** — a Lucknow-based startup building a digital marketing agency marketplace, think of it as a "JustDial meets Clutch.co" specifically for SMEs across Lucknow, Rae Bareli, Gomti Nagar, and nearby UP cities who want to hire a marketing agency but don't know which one to trust.

Before GrowthBridge launches, they've partnered with a regional trade body to get anonymized performance data from 45 agencies, 320 client engagements, and 380K+ days of campaign performance data across the market — not just one agency's data, the whole regional ecosystem.

Your manager, the Head of Product, walks into your desk with this brief:

"We're about to launch, and I need to know about every useful insights from all four csv's that I have given you so we know what problem we're actually solving. Pull this together into insights I can put in front of investors next week."

2. Data Overview

The dataset is synthetic — generated for this portfolio project, structured as four related tables to reflect a realistic regional marketing ecosystem, not a single agency's internal data.

Table	Rows (after cleaning)
agencies	45
clients	320
campaigns	1050
campaign_performances	380275

Join structure: agencies→clients→campaigns→campaign_performance, supporting multi-table SQL joins across all four levels

3. Methodology

3.1 Data Cleaning (Python)

Inconsistent categorical labels , Mixed date formats, Currency values stored as inconsistent text , Missing values , duplicate rows ... etc

3.2 Analysis (MySQL)

Cleaned data was loaded into MySQL and queried using multi-table JOINS, GROUP BY aggregation,CASE-based bucketing ... etc to answer specific business questions.

3.3 Visualization (Power BI)

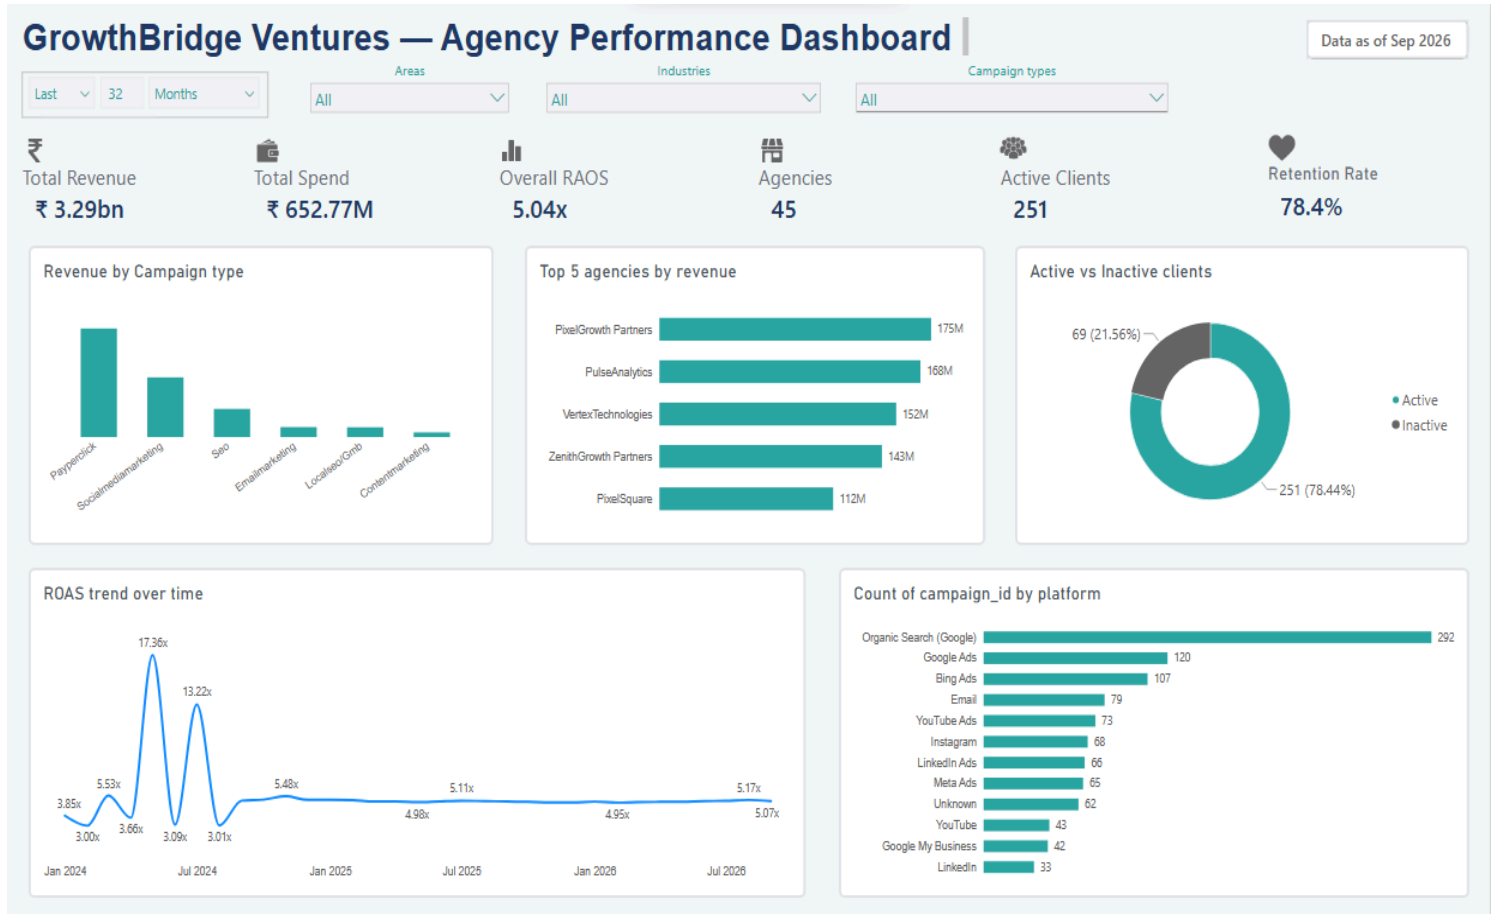

Findings were consolidated into a single-page Power BI dashboard with 6 KPI cards, 4 slicers (date, area, industry, campaign type), and 5 charts covering revenue, top agencies, client retention, ROAS trend, and platform distribution

4. Key Insights

4.1 Market Overview

Total Revenue	3.29b
Total ad spend	652.77 m
Overall Marked ROAS	5.04 x
Total agencies	45
Client Retention Rate	78.4%

4.2 Dashboard

5. Recommendations

- Do not use agency size or rating as a primary trust signal on the platform - surface actual ROAS/retention performance data instead.
- Feature small and mid-sized agencies more prominently — they show stronger average ROAS than large agencies, which challenges an easy assumption that bigger firms perform better.
- Encourage multi-channel campaign strategies for clients rather than PayPerClick - only engagements, since PayPerClick -heavy revenue concentration coincides with more volatile agency-level ROAS.
